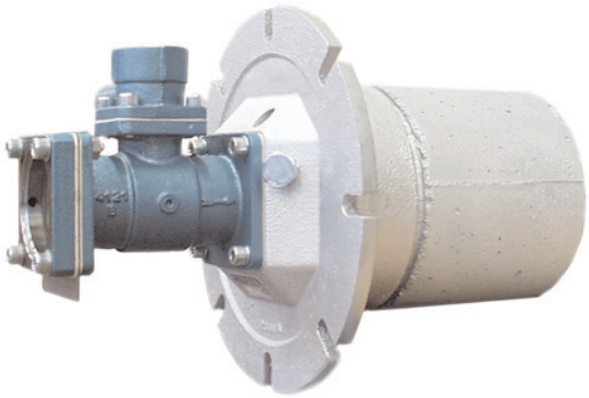
NOZZLE MIX BURNERS
NM SERIES

FEATURES

- Mixer body: Cast iron G25
- Plate: Cast iron G25
- Air tube: AISI 304
- Operation with pre-heated air up to: 450°
- Adequate to different types of gas: CH_4/L.P./propane/etc.
- Standard refractory block max. temp.: 1750°C
- Capacity range: 10 to 3700 kW
- Single tunnel turndown range: 10:1
- Multiple tunnel turndown range: 60:1
- Excellent flame stability: excess air, excess fuel, on ratio firing
- Low NO_x level.
- Wall mounting flanges to fasten the block holder to the furnace shell are threaded to allow for positioning of accessories: pilot burner, flame detectors (electrodes or UV scanners), peepsight.
- Separated air and gas inlets, mixing at discharge point, no flashback.



F3501101

APPLICATIONS

- Tank melting kilns for frits.
- Billets reheating furnace.
- Aluminium melting furnace.
- Forging furnaces.
- Air heaters.
- Heat treat furnaces.
- Incinerators.
- Stress Relieving Furnaces.
- Brick furnaces.
- Ladle and crucible melting reheating.
- Driers.

DESCRIPTION

Nozzle Mix Burners are high flame, high capacity units. Gas and air are mixed only at the point of discharge. The swirling air stream produces a negative vortex at the block mouth. Fuel enters the vortex mixing rapidly, producing intense combustion.
Nozzle Mix burners may work both with cold and pre-heated air allowing for 25 to 30% saving. When cold air is entrained, modulation of the main air valve, from a temperature controller signal, changes the air pressure and the air flow to the burner. With equal or proportional air and gas pressure drops across both orifices, the flows will always maintain correct ratios.
In case of pre-heated air, modulation of the butterfly valve, located upstream of the heat exchanger, from a temperature controller signal, changes the air pressure and the air flow to the burner. Flanged Orifice Plate meters at convenient point in the air and gas supply lines to the burners measure flows. The air impulse to the Balanced Zero Regulator will modulate the gas outlet pressure to always equal the air pressure.

INSTALLATION

NM burners are usually mounted on the wall. Other mounting positions are not recommended; specify if it is absolutely required when you order it.
The furnace refractory should be set to leave some room on all sides of the block. This space should be packed with flexible, refractory, ceramic fiber protected by 20 mm of refractory concrete on all sides to allow for expansion of the walls (see technical note). Flexible connector are recommended for air and gas connections at the burner to allow slight movement or misalignment of piping and are required when pre-heated air is involved. Air and gas connections are Pyronics' standard threaded, welding flanged type. They may rotate by 90°.

IGNITION AND FLAME DETECTION

NM burners must be ignited at low fire with a PBST blast pilot.
Pilot burner must be switched off after ignition of main burner thus flame detection must be done by counterclockwise UV Scanner. For low capacity burners direct spark ignition may be done through electrodes WAND or DSE. In this case UV-2 ultraviolet scanners must be used.
Flame detection systems are required on all burners with furnace temperatures below 750°C.

Catalog No.	Pilot burner ignition		Electrode ignition	
	Ignition	Detection	Ignition	Detection
101 NM	P42PBST-W/X	UV-2 / Wand *	14MM	UV-2
201 NM	P42PBST-W/X	UV-2 / Wand *	Wand - 201 NM	UV-2
301 NM - 601 NM	P64PBST	UV-2 / 6EN-150 *	DSE - 1	UV-2
1001 NM - 1501 NM	P64PBST	UV-2 / 6EN-300 *	DSE - 1	UV-2
2501 NM	P86PBST	UV-2 / 6EN-300 *	(not available)	(not available)
4001/6001/8001 NM	P86PBST	UV-2 / 6EN-300 *	(not available)	(not available)

(*) In most cases, we suggest you to make flame detection through UV- scanner. In some particular cases, it is possible to use continue pilot burner with detection electrode.

CAPACITY TABLE

Single tunnel	Pipe size		Maximum capacity in kW at various air and gas pressures at burner (in mbar)									Flame length mm (2)

Notes: 1) Nominal maximum capacity range.
2) Flame dimensions are approximate, referred to burners feeded with CH_4, working at stoichiometric ratio, in free air. Values are included in a range: minimum value is referred to burner working at nominal capacity (1), higher value at maximun capacity (3).
